

## ABSTRACT

This system is used for hanging and locking objects onto a single wall support with two interconnected cord loops. The loops go over the support affixed to a wall and hold the object in a stable leveled position. Initial slack in the interconnected loops has them extended above the top of the object for placing the loops on the support in full view. Removal of the slack in the loops raises the object above the wall support. A complete reduction in the slack locks the object onto the support.
